

Cuttings farm – Everything top notch. Company, planting material and the integrated lighting solution.

Switzerland is considered a pioneer in the production and development of cannabis products for medical, cosmetic and lifestyle applications. Appropriate legislation has enabled a market to develop and establish itself in recent years that meets the highest quality standards and now defines standards worldwide. In order to achieve this, right at the beginning of the production chain - with the plant starting material, the cutting - the focus was on quality and nothing was left to chance.

Jennersdorf, June 03, 2020 - The team at the cuttings farm, with its owner Jonas Jermann, specialized early on in the production of high-quality CBD cuttings according to medical-technical standards. The company has set itself the goal of selecting cannabis plants with special properties and propagating them in large numbers and with consistent quality all year round. Visionary commitment, focused discipline, an uncompromising quality standard, but also the careful selection of partners have set new standards. Today, the cuttings farm builds on the FLEX-PRO LED series from the total solution provider SANSOL for the lighting solution. Among other things, it contributes to the rapid and healthy development of the plant, hardens it and provides the ideal starting point for the formation of active ingredients. This is always in strict compliance with the legal requirements in the area of THC concentration. Thanks to the perfect interplay of experience, commitment and a constructive partnership, customers of the cuttings farm can enjoy a high flower yield, high-quality buds and constantly optimized genetics. Quality and customer satisfaction are of the highest priority, positioning the cuttings farm in the industry as a valued, innovative and reliable supplier of the highest quality planting material.

The use of the SANSOL FLEX-PRO LED lights when rooting the CBD cuttings results in the following advantages:

- rapid rooting
- high rooting rate
- extremely robust cuttings
- reduced light stress during further cultivation
- reduced culture times

The light spectrum of the FLEX-PRO LED lights has a positive influence on and stimulates the cuttings' metabolism right from the start, which is ultimately reflected in the yield in an extremely profitable manner.
